

# PER-APP-VPN

## INTRODUCTION

VPN means Virtual Private Network and offers the possibility to access the network from outside of the firm. MobiVisor-VPN encrypts the web traffic of your employees in real-time. If a mobile device quits safe firm WLAN, an encrypted connection to the firm server is built up and the device is protected in unsafe/ open WLAN.

## FUNCTIONS

MobiVisor VPN guarantees encrypted traffic in order to prevent the interception of Emails or online communication, which not only implies E-Mail but all sorts of communication applications. With MobiVisor VPN you have a high device protection which guards your firm mobile devices from Ransomware and harmful content. End users are prevented from visiting harmful websites or phishing sites. That way browser protection is ensured. MobiVisor-VPN offers a modern ultralight technology for a low system load and high performance.

## VPN VS. PER-APP-VPN

VPNs are mostly offered as a Whole-Device-VPN. That means that you cannot define the apps and domains which should run via VPN. This requires that the whole traffic of a device runs via VPN. If you use more devices, the traffic is summarized which involves undesired server overload and performance degradation. Protect your resources and therefore use our **Per-App-VPN**.

## PER-APP-VPN

Per-App-VPN enables the individual selection of apps which should be activated for VPN. Here are two variants: *inhouse-VPN* and *custom-SSL*.

*Inhouse-VPN* means that you use our VPN; *custom-SSL* in contrast enables the usage of any VPN chosen by you. We prepare the configurations in both cases.

## UNCOMPLICATED SETUP

The configuration of MobiVisor-VPN is made via the MDM-Portal and can be shared with all other mobile devices remotely. That saves you annoying drive and transport ways. Do you need help for the setup? If required, you get support from our staff for free!

As soon as the configurations are arrived on the devices, you don't need to do anything more. The device is protected immediately.

*(iOS solely requires the configurations. For Android there must be downloaded our VPN application on the device additionally.)*

## HOME OFFICE FOR EVERYONE!

Thanks to simple pre-configuration of the MobiVisor-VPN no other cumbersome handgrips on the device are needed. So, our solution is suitable for all users without any

technical knowledge. We enable home office for everyone. What do you wait for? Enable working from everywhere for your staff!

## TECHNICAL DETAILS

After the users log in on their devices, requests are sent from the MDM server to the Web and VPN servers for the creation of VPN-certificates. These confirm the certificates and send them back to the MDM server. The configurations are created in the admin interface and are sent to the devices. Afterwards, requests are sent via the VPN-tunnel to the internal servers. These requests differ from the VPN usage of the users.
